

QR API Example

- Here I created a sample code with QR code generation API that you send

- For now I set a static link for the both QR code when we scan this open that link something like bellow image or open that link into browser

-

QR Code

<https://www.google.com/>

Open Close

How can use this in our website

- We can use this for share member / mentor and advisor profile publicly like linked in , Facebook and other social media platform
- By using this api we can create dynamic link and generate QR code for that link so the user can share that QR code and someone is scan it the the public profile page is open.
- I think this is a quick way to share member and mentor profile on social media
- url example
 - o <https://the-source.ai/profile/rajesh-thakor>
